The invention relates to a composition (A1) comprising compounds containing monomers, multimers or polymers of TKPPR (ADD10664).

Composition (A1) comprises a compound of formula A-L-B 1, where A is the TKPPR peptide, L is a linker moiety (of formula given in the specification) and B is a substrate (or a phospholipid group, derivatisable bead attached to a fluorescent or radioactive marker, bioactive agent, delivery vehicle for genetic material, drug or therapeutic, or chelating group (preferably N 4 , S 4 , N 3 5, N 2 S 2 or NS 3) comprising oxa-PnAO complexed with 99m Tc). The compound specifically binds to NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoptotein) or cells that express NP-1 with avidity of at least that of TKPPR. Also included are an ultrasound

The present invention relates to novel highly functionalised phosphine ligands which can be used as ancillary ligands in radiopharmaceuticals. These radiopharmaceuticals can then be used to radioimage a patient, enabling the visualisation of platelet deposition and disease sites, and allowing the diagnosis of infection, inflammation, transplant rejection, cardiovascular diseases such as thromboembolic disorders, and cancer. The present sequence is a peptide which formed part of a ligand in the exemplification of the invention

Sequence 5 AA;

New ancillary ligands are useful as ligands for radiopharmaceuticals, which are useful for e.g. radioimaging a patient, diagnosing thromboembolic disorders, atherosclerosis, infections and inflammation.

WPI; 2002-010884/01.

```
contrast agent (c1) comprising a suspension of gas filled microbubbles comprising the TRPPR compound, an ultrasound contrast agent (c2) comprising a suspension of gas filled microballoons comprising the TRPPR compound, which comprises conjugating to compound, preparation of the TRPPR compound (which comprises conjugating to be compound of formula A-L, forming a covalent or non-covalent to obtain a compound of formula A-L, forming a covalent bond between to obtain a compound of form a conjugate B-L followed by conjugation with B-L and the linker to form a conjugate B-L followed by conjugation with the compound. The compound used for targeting endothelial cells, tumour cells or other cells which express NP-1, for inhibiting angiogenesis, for ultrasound imaging, staging a tumour, screening at least one targeted ultrasound contrast agent for the ability to target endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic delivery in vivo of a bioactive agent and for delivering desired nucleic acids to endothelial cells, tumour cells or other cells which express NP-1. The composition is also useful for visualisation therapy or radiotherapy of endothelial cells. The present sequence is the TRPPR

Awilo53 is a peptide used for targetting agents to leukocytes. This peptide can be coupled to a metal radionuclide chelator (structural form) in the specification), labelled with a diagnostically useful metal isotope, to form a peptide derived radionuclide chelator. When the chelator is coupled to a targeting molecule and labelled with a diagnostically useful metal, it can be used to detect pathological conditions by diagnostic imaging. For example, AAWI1053 targets the conditions by diagnostic imaging. For example, AAWI1053 targets the conditions by diagnostic imaging. For example, AAWI1053 targets the conditions by diagnostic imaging. For example, 203Pb, 212Pb and 212Bi. The local inflammation. Radionuclides useful for the rapid imaging of fittes of a largeting agent and radionuclide using a chelating agent is an alternative to the direct labelling of targeting agents in which radionuclides are typically bound at the more numerous low- affinity sites, forming unstable complexes. The new conjugates give better scintigraphic images in rat inflammation studies than known imaging agents Ga-67, 99mc-1gG, 111n-WEC and 99mfrc-Manocoll. They image more rapidly than the known agents and show superior biodistribution
                                                                                                                                                                                                                                                        ;

or antibodies. The labelled targetting molecules may be used for in-vivo diagnosis and therapy. The chelating compound is a hydrazino-containing, N-heterocycle-containing compound, and the conjugated product is exemplified by S-Aon-mercaptoacetyl-Ser-N- methyl-hydrazino-nicotinic
                                                                          acid_Gly_thr-ivs-pro-Pro-Arg. The peptide portion of this molecule (the present sequence) represents the tuftsin antagonist TRPPR condensed via Gly onto the chelating moiety, giving a molecule which will chelate a radionuclide such as $9mTc and target it towards leukocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Leukocyte, target, direct, chelator, radionuclide, radiolabel, isotope, diagnostic imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New peptide derived radionuclide chelators and metal complexes - useful for diagnostic imaging.
                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                        .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW31148 is a peptide conjugate of an amyloid plaque-targeting peptide and a new hydrazino-type compound. The new compound is a radionuclide chelator and is used to radiolabel targeting peptides for the detection and disquestic imaging of sites of discase, e.g. amyloid plaques in Alzheimer's disease, thrombi in thrombosis or other sites of infection. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAW31110-W31147 are peptides used for targeting a new hydrazino-type compound to various sites of disease, e.g. atherosclerotic plaque, sites of infection, platelets, thrombus or amyloid plaque. The new compound is a radionuclide chelator and is used to radiolabel the targeting peptides for the detection and diagnostic imaging of sites of disease, e.g. amyloid plaques in Alzheimer's disease. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /label= Acp

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FILLEX
                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                     The present invention describes polypeptide compounds of formula (I), capable of direct transformation into a radiopharmaceutical: Ch-Ln-(X1-X2-X4-X5) (I), where X1-X5 = amino acids; Ln = a linking group; Ch = a metal bonding unit; and dis selected from 1, 2 and 3. The radiopharmaceuticals are useful for the diagnosis of infection, that lammation and cancer. The radiopharmaceuticals bind in vivo to the tuftsin receptor on the surface of white cells which accumulate at the site of infection and inflammation and can then be detected using radiation detecting probes or by imaging using a planar or ring gamma camera. The radiopharmaceuticals can also be used in treating cancer. The present sequence represents a specifically claimed tuffsin receptor antagonist chelate conjugate from the present invention

The invention relates to a composition for use in targeting endothelial cells, tumour cells, or other cells which express NP-1. The activity of compositions of the invention may be described as cytostatic. Compounds of the invention may be described as cytostatic. Compounds of the invention are useful in pharmaceutical compositions for inhibiting angionates, for imaging and targeting an angiogenic site, endothelial cells, tumour in a human or animal. They may also be used as ultrasound contrast agents, for staging a tumour in a human or animal, for secening for the ability of an agent to target endothelial cells, tumour cells or other cells that express NP-1. They may be used for therapeutic delivery in vivo of a bloactive agent or target endothelial cells, tumour cells or other cells that captered so related disorder. They may be used for delivering desired nucleic acids to endothelial cells, tumour cells or other cells expressing NP-1, for charge disorder. They may be used for delivering desired nucleic acids to endothelial or tumour cells or other cells expressing NP-1, for charge the disorder. They may be used for delivering desired nucleic acids to endothelial or tumour cells, and for treating a human or animal therapy targeting angiogenic cells, and for treating a human or animal with a tumour or angiogenesis related disease. The current sequence
                                                                                                                                                                                                                                                                                                    Composition for use in targeting endothelial cells, tumor cells or other cells which express NP-1 comprises a compound containing a polypeptide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               represents a tuftsin receptor antagonist (TKPPR) derivative of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ternary ligand complex; highly functionalised phosphine ligand; disease site; cardiovascular disorder; thromboembolic disease; atherosclerosis; infectious disease; cancer; radiopharmaceutical.

                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel highly functionalised phosphine ligands which can be used as ancillary ligands in radiopharmaceuticals. These radiopharmaceuticals can then be used to radioimage a parient, enabling the visualisation of platelet deposition and disease sites, and allowing the diagnosis of infection, inflammation, transplant rejection, eardiovascular diseases such as thromboembolic disorders, and cancer. The present sequence is a peptide which formed part of a ligand in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                    New ancillary ligands are useful as ligands for radiopharmaceuticals, which are useful for e.g. radioimaging a patient, diagnosing thromboembolic disorders, atherosclerosis, infections and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Gaps

```
The present invention relates to novel highly functionalised phosphine ligands which can be used as ancillary ligands in radiopharmaceuticals. These radiopharmaceuticals can then be used to radioimage a patient, enabling the visualisation of platelet deposition and disease sites, and allowing the diagnosis of infection, inflammation, transplant rejection, eardiovascular diseases such as thromboembolic disorders, and cancer. The present sequence is a peptide which formed part of a ligand in the exemplification of the invention
                                                                                                                                                                                 New ancillary ligands are useful as ligands for radiopharmaceuticals, which are useful for e.g. radioimaging a patient, diagnosing thromboembolic disorders, atherosclerosis, infections and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Phagocytosis, tuftsin, endothelial cell, inflammation, cytostatic, antiangiogenic, NP-1, ultrasound contrast agent, tumour, angiogenesis, visualisation therapy, radiotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

The invention relates to a composition (A1) comprising compounds Containing monomers, multimers or polymers of TKPFR (ADD10684).

Composition (A1) comprises a compound of formula A-LB 1, where A is the TKPFR peptide, L is a linker moiety (of formula given in the Specification) and B is a substrate (or a phospholipid group, derivers bead attached to a fluorescent or radioactive marker, biocactive agent, delivery vehicle for genetic material, drug or therapeutic, or chelating group (preferably N 4, S 4, N 3 S, N 2 S or N 3 3 comprising oxa-PnAO complexed with 99m rO. The compound or avidity of at least that of TKPPR. Also included are an ultrasound contrast agent (C1) comprising a suspension of gas filled microbubles comprising the TKPPR compound, an ultrasound contrast agent (C1) comprising a suspension of gas filled microbubles comprising the TKPPR compound, an ultrasound contrast agent (C1) comprising a suspension of gas filled microbubles comprising a suspension of gas filled microbubles comprising the TKPPR compound (which comprises conjugating the monomer, multimer or polymer of TKPPR or its analogue with a linker to comprise a compound of formula A-L, forming a covalent or non-covalent condomer, and a ktt for preparing a radiopharmaceutical comprising the compound used for targeting endothelial cells, tumour cells or other cells which express NP-1, for inhibiting angiogenesis, cultrasound contrast agent for the abbility to target endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic delivery in vivo of a bioactive agent and for delivering desired nucleic acids to emothelial cells, tumour cells or other cells withen express NP-1. The transport in a salso useful for visualisation therapy or analogue is a TKPPR analogue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Phagocytosis; tuftsin; endothelial cell; inflammation; cytostatic; antiangiogenic; NP-1; ultrasound contrast agent; tumour; angiogenesis; visualisation therapy; radiotherapy.

deriversemble bead attached to a librorescent or required to the deriver, delivery vehicle for genetic material, drug or therapeutic, or chelating group (preferably N 4, S 4, N 3 S, N 2 S 2 or N S 3 , composition das PADA complexed with 99m Tc). The compound specifically binds to NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoprotein) or cells that express NP-1 with a validity of a least that of TRPPR. Also included are an ultrasound contrast agent (c1) comprising a suspension of gas filled microbubbles comprising the TRPPR compound contrast agent (c2) comprising the TRPPR compound contrast agent (c2) comprising of suspension of gas filled microbubbles comprising the TRPPR compound (which comprises conjugating the monomer, multimer or polymer of TRPPR or its analogue with a linker to obtain a compound of formula A-L, forming a covalent bond between the linker to form a conjugate B-L followed by conjugation with bond between A-L and the substrate B 1 or forming a covalent bond between CC the monomer), and a fit for preparing a radiopharmaceutical comprising the compound. The compound used for targeting endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic cultrasound contrast agent for the ability to target endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic condition is also useful for visualisation therapy or analysis of endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic condition is also useful for visualisation therapy or analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a composition (A1) comprising compounds containing monomers, multimers or polymers of TKPPR (ADD10684).
Composition (A1) comprises a compound of formula A-L-B 1, where A is the TKPPR peptide, L is a linker moiety (of formula given in the specification) and B is a substrate (or a phospholipid group, derivatisable bead attached to a fluorescent or radioactive marker,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Composition used in targeting endothelial cells e.g. tumor cells comprises compounds containing monomers, multimers or polymers of Larginine-L-threonyl-L-lysyl-L-prolyl-L-prolyl.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ramalingam K;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ..

radiation detecting probes or by imaging using a planar or ring gamma camera. The radiopharmaceuticals can also be used in treating cancer. The present sequence represents a specifically claimed tuftsin receptor antagonist chelate conjugate from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes polypeptide compounds of formula (I), capable of direct transformation into a radiopharmaceutical: Ch-Ln-(X1-X3-X4-X5) (I), where X1-X5 = amino acids, Ln = a linking group; Ch = metal bonding unit; and dis selected from 1, 2 and 3. The radiopharmaceuticals are useful for the diagnosis of infection, inflammation and cancer. The radiopharmaceuticals bind in vivo to the tuffein receptor on the surface of white cells which accumulate at the site of infection and inflammation and can then be detected using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptides and radiopharmacueticals used for imaging infection, inflammation and cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes polypeptide compounds of formula (I), capable of direct transformation into a radiopharmaceutical: Ch-Ln-(XI-X2-X4-X5)d (I), where XI-X5 = amino acids, Ln = a linking group; Ch = a metal bonding unit; and d is selected from 1, 2 and 3. The radiopharmaceuticals are useful for the diagnosis of infection, inflammation and cancer. The radiopharmaceuticals bind in vivo to the tuftsin receptor on the surface of white cells which accumulate at the site of infection and inflammation and can then be detected using radiation detecting probes or by imaging using a planar or ring gamma camera. The radiopharmaceuticals can also be used in treating cancer. The present sequence represents a specifically claimed tuftein receptor antagonist chelate conjugate from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polypeptides and radiopharmacueticals used for imaging infection, inflammation and cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a composition for use in targeting endothelial cells, tumour cells, or other cells which express NP-1. The activity of compositions of the invention may be described as cytostatic. Compounds of the invention may be described as cytostatic. Compounds of the invention are useful in pharmaceutical cappositions for inhibiting angiogenesis, for imaging and targeting an analogenic site, endothelial cells tumour cells or other cells the express NP-1 in a human or animal. They may also be used as ultrasound contrast agents, for staging a tumour in a human or animal, for scenning for the ability of an agent to target endothelial cells, tumour cells or other cells that express NP-1. They may be used for therapeutic delivery in vivo of a bloactive agent or farted disorder. They may be used for delivering desired nucleic acids to endothelial cells, tumour cells or other cells expressing NP-1, for charged disorder. They may be used for delivering desired nucleic acids to endothelial or tumour cells or other cells expressing NP-1, for charge to an analogenic cells, and for treating a human or animal therapy targeting analogenesis related disease. The current equence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The invention relates to a composition for use in targeting endothelial cells, tumour cells, or other cells which express NP-1. The activity of compositions of the invention may be described as cytostatic. Compounds of the invention are useful in pharmaceutical compositions for inhibiting angiogenesis, for imaging and targeting an angiogenic site, endothelial cells, tumour cells or other cells that express NP-1 in a human or animal. They may also be used as ultrasound contrast agents, for staging a tumour in a human or animal, for screening for the ability of an agent or exrect endothelial cells, tumour cells or other cells that express NP-1. They may be used for therapeury in vivo of a bicactive agent or for treating an individual exhibiting effects of an angiogenesis or a related disorder. They may be used for delivering desired muclelc acids concluded the composition of the cells that express not condothelial cells, tumour cells or other cells expressing NP-1, for chancing endothelial or tumour cells or other cells expressing NP-1, for characty targeting angiogenesis-related disease. The current sequence represents a tuffesh receptor antagonist (TKPPR) derivative of the represents a tuffesh receptor antagonist (TKPPR) (BRU-305 and BRU-306)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "Fmoc-Cys(Trt)-OH; residue optionally modified by

The invention relates to a composition (A1) comprising compounds containing monomers, multimers or polymers of TKPPR (ADD10684).

Composition (A1) comprises a compound of formula A-LB 1, where A is the TKPR peptide, L is a linker molety (of formula given in the TKPR peptide, L is a linker molety (of formula given in the TKPR peptide, L is a linker molety (of formula given in the Specification) and B is a substrate (or a phospholipid group, carivatisable bead attached to a fluorescent or radioactive marker, bloactive agent, delivery vehicle for genetic material, drug or therapeutic, or chelating group (preferably N 4, S 4, N 3 5, N 2 5 2 or NS 3) comprising or NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoprotein) or cells that express NP-1 with specifically binds to NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoprotein) or cells that express NP-1 with sound contrast agent (c1) comprising a suspension of gas filled microbables compusing a suspension of fas filled microballoons comprising the TKPPR compound, an ultrasound contrast agent (c2) comprising a suspension of fas filled microballoons comprising the TKPPR compound (which comprising the TKPPR compound, (which comprising the TKPPR compound, (which comprising the TKPPR compound, (which comprises conjugating the monomer, multimer or polymer of TKPPR or its analogue with a linker to obtain a compound of formula A-L, forming a covalent bond between a land the linker to form a conjugate B-L followed by conjugation with

```
the monomer), and a kit for preparing a radiopharmaceutical comprising the compound. The compound used for targeting endothelial cells, tumour cells or other cells which express NP-1 for inhibiting angiogenesis, for ultrasound imaging, stading a tumour, screening at least one targeted ultrasound contrast agent for the ability to target endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic delivery in vivo of a bioactive agent and for delivering desired mucleic acids to endothelial cells, tumour cells or other cells which express NP-1. The composition is also useful for visualisation therapy or radiotherapy of endothelial cells. The present sequence is a cyclic TKPPR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Phagocytosis, tuftsin, endothelial cell, inflammation, cytostatic; antiangiogenic; NP-1, ultrasound contrast agent; tumour; angiogenesis; visualisation therapy; radiotherapy.
                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Composition used in targeting endothelial cells e.g. tumor cells comprises compounds containing monomers, multimers or polymers of Larginine-L-threonyl-L-lysyl-L-prolyl-L-prolyl-L-prolyl.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a composition (A1) comprising compounds

CC containing monomers, multimers or polymers of TKPPR (ADD10684).

CC Composition (A1) comprises a compound of formula A-Le 1, where A is the TKPPR peptide, Lis a linker moiety (of formula given in the compound of the compound of the compound of the composition of the compound of the compound of derivatisable bead attached to a fluorescent or radioactive marker, delivery vehicle for genetic material, drug or.

NS 3 comprising acase PRAD complexed with 99m Tc). The compound specifically binds to NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoprotein) or cells that express NP-1 with avidity of at least that of TKPRP. Also included are an ultrasound contrast agent (C1) comprising a suspension of gas filled microbubles comprising the TKPPR compound, an ultrasound contrast agent (C1) comprising a suspension of gas filled microballoons comprising to the TKPPR compound (which comprises conjugating the monomer, multimer or polymer of TKPPR or its analogue with a linker to compound of formula A-L; forming a covalent or non-covalent compound. The compound used for targeting endothelial cells, tumour cells or other cells which express NP-1, for inhibiting anglogenesis, for the compound used for targeting endothelial cells, tumour cells or other cells which express NP-1, for inhibiting anglogenesis, for ultrasound imaging, staging a tumour, screening at least one targeted ultrasound imaging, staging a tumour, screening at least one targeted ultrasound imaging, staging a tumour, screening at least one targeted ultrasound imaging, staging a tumour, screening at least one targeted ultrasound contrast agent for the ability to target endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic acids to endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic acids to endothelial cells, tumour cells or other cells which express NP-1, for the composition is also useful for visual
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "the side-chain (epsilon) amino group of Lys at position 7 forms a peptide bond with the C-terminus of the terrapeptide N', N-dimethylgylycyl-Ser-Cys(Acm) -Gly-; this sidechain group consists of a tripeptide metal chelator and a linking residue (Gly)".

The present sequence is that of a specifically claimed peptide - chelator conjugate in which a tuftsin antagonist peptide is coupled to a metal chelator, via a linking group. The chelator serves as a labelling site for radionuclide metals such as technetium.99m. The tuftsin antagonist targets the conjugate to macrophages and neutrophils at sites of inflammation without significant accumulation in the gastrointestinal tract (unlike the native tuftsin tetrapeptide). The conjugate is thus useful for diagnostic imaging of inflammation sites, providing an improved target to background ratio

AAWII054-WII059 are peptide derived radionuclide chelators that are targetted to leukocytes, via the GTKPPR sequence. When the chelators are coupled to a targeting molecule and labelled with a diagnostically useful metal, they can be used to detect pathological conditions by diagnostic imaging. The leukocyte-targetted chelators are useful for the rapid imaging of sites of local inflammation. Radionuclides used include 99mTc, 64Cu, 67Cu, 97Ru, 105Rh, 109Pd, 186Re, 188Re, 198Au, 199Au, 201Pb, 212Pb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 3; Page 14; 30pp; English.

The present invention describes polypeptide compounds of formula (I), capable of direct transformation into a radiopharmaceutical: Ch-Ln-(X1-X2-X3-X4-X5)d (I), where X1-X5 = amino acide; Ln = a linking group; Ch = a metal bonding unit; and d is selected from 1, 2 and 3. The radiopharmaceuticals are useful for the diagnosis of infection, inflammation and cancer. The radiopharmaceuticals bind in vivo to the tuftsin receptor on the surface of white cells which accumulate at the site of infection and inflammation and can then be detected using radiation, detecting probes or by imaging a planar or ring gamma
and 212Bi. The coupling of a targeting agent and radionuclide using a chelating agent is an alternative to the direct labelling of targeting agents in which radionuclides are typically bound at the more numerous low-affinity sites, forming unstable complexes. The new conjugates give better scintigraphic images in rat inflammation studies than known imaging agents Ga-67, 99mTc-IgG, 111In-WBC and 99mTc-Nanocoll. They image more rapidly than the known agents and show superior biodistribution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note= "modification on the COOH side group: -Acp-Thr-Lys-Pro-Pro-Arg"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Leukocyte, target, direct, chelator, radionuclide, radiolabel, isotope,
diagnostic imaging.
                                 ns. for generating metal labelled imaging agents - comprising a support, a linking gp. and a ligand cleavable from the linking gp.
                                                                                                                                           Peptides AAR76218-9 are examples of peptide-ligands used in a method to produce a metal-labelled imaging agent. The method comprises attaching ligand-target molecule e.g. a peptide to a solid surface via a linking group e.g. malefinide. The ligand can incorporate a metal atom e.g technetium, which cleaves the linker-ligand bond thus releasing a labelled peptide. The labelled peptide can then be used for imaging in tissues, cell types or organs
                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                              ò

The activity of compositions of the invention may be described as cytostatic. Compounds of the invention are useful in pharmaceutical compositions for inhibiting angiogenesis, for imaging and targeting an angiogenic site, endothelial cells, tumour cells or other cells that express NP-1 in a human or animal. They may also be used as ultrasound contrast agents, for staging a tumour in a human or animal, for screening for the ability of an agent to target endothelial cells, tumour cells or other cells that express NP-1. They may be used for therspettic delivery in vivo of a bioactive agent or for treating an individual exhibiting effects of an angiogenesis or a
                                                                                                                                                                                                                                                                                                                                                      /note= "residue modified by the addition of the following block of residues (RPPKT)"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The patent discloses new metal-chelating peptide analogues of formula chel-xaa-Cys-X, in which: Chel is a chelating moiety which is the residue of a heterocyclic amino acid analogue such as picolinic acid, dipicolinic acid, c-carboxypyrazine, 2-carboxypyrimidine, 2-carboxypyrrole, 2-quinolinic acid or 2- or 3-isoquinolinic acid; Xaa is an amino acid residue, he Cys residue is optionally protected; and X is OH, alkoxy, an amino acid residue or a targetting moiety (TM). Preferably Xaa is Gly or Ser; X is Gly-OH or Gly-TM, and TM is a cell receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /label= OTHER /note= "residue of 2-quinolinic acid, 1- or 3- isoquinolinic acid, pyrrole-2-carboxylic acid or indole-2 -carboxylic acid"
related disorder. They may be used for delivering desired nucleic acids to endothelial cells, tumour cells or other cells expressing NP-1, for enhancing endothelial or tumour cell-targeted gene therapy, or gene therapy targeting angiogenic cells, and for treating a human or animal with a tumour or angiogenesis-related disease. The current sequence represents a tuftsin receptor antagonist (TKPPR) derivative tetramer BRU-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New peptide analogue metal chelator(s) - used for chelating radioactive metals for in-vivo diagnostic imaging or for therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              chelate; chelating; chelator; diagnostic; imaging; therapy; tuftsin.

binding peptide. The molecule can be used to chelate a diagnostically or therapeutically useful metal such as 99m-Tc, and the targetting moiety can be used to direct the molecule to a site of interest within the body for in-vivo diagnostic imaging or the therapy. The present sequence represents specifically claimed examples of the new peptides, in which the targetting peptide is a tuftsin antagonist
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptide analogue metal chelator(s) - used for chelating radioactive metals for in-vivo diagnostic imaging or for therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The patent discloses new metal-chelating peptide analogues of formula

New peptide-chelator conjugate and complex with traceable metal - used to image sites of inflammation in vivo without significant accumulation on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of a specifically claimed peptide - chelator conjugate in which a tuftsin antagonist peptide is coupled to a metal chelator, via a linking group. The chelator serves as a labelling site for radiomuclide metals such as technetium-99m. The tuftein antagonist targets the conjugate to macrophages and neutrophils at sites of inflammation without significant accumulation in the gastrointestinal tract (unlike the native tuftsin tetrapeptide). The conjugate is thus useful for diagnostic imaging of inflammation sites, providing an
for in-vivo diagnostic imaging or for therapy. The present sequence represents a specifically claimed example of the new peptides, in which the targetting peptide is a tuftsin antagonist
                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of a specifically claimed peptide- chelator conjugate in which a tuftsin antagonist peptide is coupled to a metal chelator, via a linking group. The chelator serves as a labelling site for radionuclide metals such as technetium 99m. The tuftsin antagonist targets the conjugate to macrophages and neutrophils at sites of inflammation without significant accumulation in the gastrointestinal tract (unlike the native tuftsin tetrapeptide). The conjugate is thus useful for diagnostic imaging of inflammation sites, providing an improved target to background ratio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptide-chelator conjugate and complex with traceable metal - used t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of a specifically claimed peptide- chelator conjugate in which a tuftsin antagonist peptide is coupled to a metal chelator, via a linking group. The chelator serves as a labelling site for radionacide metals such as technetium-99m. The tuftsin antagonist targets the conjugate to macrophages and neutrophils at sites of inflammation without significant accumulation in the gastrointestinal tract (unlike the native tuftsin tetrapeptide). The conjugate is thus useful for diagnostic imaging of inflammation sites, providing an improved target to background ratio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "the side-chain (epsilon) amino group of Lys at position 8 forms a peptide bond with the C-terminus of the tetrapeptide N',N-dimethylglycyl-Ser-Cys(Acm)-Gly-; this sidechain group consists of a tripeptide metal chelator and a linking residue (Gly)".

                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptides AAR76218-9 are examples of peptide-ligands used in a method to produce a metal-labelled imaging agent. The method comprises attaching a ligand-target molecule e.g. a peptide to a solid surface via a linking group e.g. maleimide. The ligand can innocroprate a metal atom e.g technetium, which cleaves the linker-ligand bond thus releasing a labelled peptide. The labelled peptide can then be used for imaging in tissues, cell types or organs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Compsns. for generating metal labelled imaging agents - comprising a solid support, a linking gp. and a ligand cleavable from the linking gp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

AAW11054-W11059 are peptide derived radionuclide chelators that are targetted to leukocytes, via the GTKRPR sequence. When the chelators are coupled to a targetting molecule and labelled with a diagnostically useful metal, they can be used to detect pathological conditions by diagnostic imaging. The leukocyte-targetted chelators are useful for the rapid imaging of sites of local inflammation. Radionuclides used include 99mTc, e4Cu, 67Cu, 97Ru, 105Rh, 109Rd, 188Re, 188Re, 188Re, 199Au, 203Pb, 212Pb and 212Bi. The coupling of a targeting agent and radionuclides using a gents in which radionuclides are typically bound at the more numerous low-affinity sites, forming unstable complexes. The new conjugates give better scintigraphic images in rat inflammation studies than known imaging agents Ga-67, 99mTc-1GG, 111In-WBC and 99mTc-Nanocoll. They image more rapidly than the known agents and show superior biodistribution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Leukocyte-targetted peptide derived radionuclide chelator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 9;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AMMINOS4-WINOS9 are peptide derived radionuclide chelators that are targetted to leukocytes, via the GTKPPR sequence. When the chelators are coupled to a targeting molecule and labelled with a diagnostically useful metal, they can be used to detect pathological conditions by diagnostic imaging. The leukocyte-targetted chelators are useful for the rapid imaging of sites of local inflammation. Radionuclides used include 99mTc, 64Cu, 67Cu, 97Ru, 105Rh, 109Gd, 186Re, 188Re, 198Au, 195Au, 203Fb, 212Pb and 212Bi. The coupling of a targeting agent and radionuclide using a chelating agent is an alternative to the direct labelling of targeting agents in which radionuclides are typically bound at the more numerous low-affinity sites, forming unstable complexes. The new conjugates give better scintigraphic images in rat inflammation studies than known imaging agents Ga-67, 99mTc-19G, 111In-WBC and 99mTc-Nanocoll. They image more rapidly than the known agents and show superior biodistribution

```
AAWI1054-WI1059 are peptide derived radionuclide chelators that are targetted to leukocytes, via the GTKDPR sequence. When the chelators are coupled to a targeting molecule and labelled with a diagnostically useful metal, they can be used to detect pathological conditions by diagnostic imaging. The leukocyte-targetted chelators are useful for the rapid imaging of sites of local inflammation. Radionuclides used include 99TC 64Cu, 67Cu, 97Ru, 105Rh, 109Gh, 186Re, 188Re, 198Au, 199Au, 203Db, 212Pb and 212Bi. The coupling of a targeting agent and radionuclide using a chelating agent is an alternative to the direct labelling of targeting agents in which radionuclides are typically bound at the more numerous low-affinity sites, forming unstable complexes. The new conjugates give better scintigraphic images in rat inflammation studies than known imaging agents Ga-67, 99TC-111In-WBC and 99TTC-Nanocoll. They image more rapidly than the known agents and show superior biodistribution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New peptide derived radionuclide chelators and metal complexes - useful for diagnostic imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          target; direct; chelator; radionuclide; radiolabel; isotope;

                                                                                                                                                                                                                                                                                                                                                                                          엄
                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                        targetted to leukcoytes, via the GTKPPR sequence. When the chelators are coupled to a targeting molecule and labelled with a diagnostically useful metal, they can be used to detect pathological conditions by diagnostic imaging. The leukcoyte-targetted chelators are useful for the rapid imaging of sites of local inflammation. Radionuclides used include 99mTc, 64Cu, 67Cu, 97Ru, 105Rh, 109Rd, 186Re, 188Re, 198Au, 199Au, 201Pb, 212Pb and 212Bi. The coupling of a targeting agent and radionuclide using a gents in which radionuclides are typically bound at the more numerous low-affinity sites, forming unstable complexes. The new conjugates give better scintigraphic images in rat inflammation studies than known imaging agents Ga-67, 99mTc-18G, 111II-WBC and 99mTc-Nanocoll. They image more rapidly than the known agents and show superior biodistribution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Leukocyte; target; direct; chelator; radionuclide; radiolabel; isotope; diagnostic imaging.
                                                                                                           New peptide derived radionuclide chelators and metal complexes - useful for diagnostic imaging.

```
AAWII054-WI1059 are peptide derived radionuclide chelators that are targetted to leukocytes, via the GTKPPR sequence. When the chelators are coupled to a targeting molecule and labelled with a diagnostically useful metal, they can be used to detect pathological conditions by diagnostic imaging. The leukocyte-targetted chelators are useful for the rapid imaging of sites of local inflammation. Radionuclides used include 99mTc 4ful, 67Cu, 97Ru, 105Rh, 109G4, 186Re, 188Re, 198Au, 199Au, 201Pb, 212Pb and 212Bi. The coupling of a targeting agent and radionuclide using a chelating agent is an alternative to the direct labelling of targeting agents in which radionuclides are typically bound at the more numerous low-affinity sites, forming unstable complexes. The new conjugates give better scinigraphic images in rat inflammation studies than known imaging agents Ga-67, 99mTc-18G, 111In-WBC and 99mTc-Nanocoll. They image more rapidly than the known agents and show superior biodistribution
New peptide derived radionuclide chelators and metal complexes - useful for diagnostic imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /label= ligand derivatised residue /note= " a galactosyl residue is attached to the thiol group of this Cys via a cleavable maleimido-containing coupling group"

                                                                                                                                                                                                                                                                                                                                        à
                                                                                                                                                                                                                                                                g
                                                                                                                perfides comprise (1) an imaging agent (a chelator for a traceable metal) which localises selectively at an in-vivo site of diagnostic interest; (2) a ligand which localises at a point (in vivo) removed from the site of diagnostic interest; and is a metal-cleavable bond coupling the chelator of the imaging agent to the ligand, this bond being cleaved upon the chelator of a coordination complex of the metal and chelator. Preferably the chelator is the sequence N.N-dimethyl- Gly-Ser-Cys, the ligand is a particosyl residue; the traceable metal is 99m-TC; and a targetting conclecule (especially TKPRR) is attached to the chelator. Upon labelling, the ligand is cleaved, leaving the labelled imaging agent free to localise at the site of diagnostic interest unhindered, while the ligand and any unlabelled imaging agent are sequestered to the removed site. By sequestering unlabelled imaging agent, the labelled imaging agent does not compete to occupy the site of interest, resulting in images of enhanced resolution. The present sequence is the preferred molecule used for imaging, in which a galactosyl residue is attached to the thiol group of Cys(3) via a cleavable maleimido coupling group
                                                                                                                                                                                                                                                                                                                                                                                       ö
                                New cpd. for use in diagnostic imaging - consists of imaging agent, which is chelator for traceable metal, coupled by metal-cleavable bond to ligand which localises at different site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chirally pure peptide; metal complex; diagnostic imaging; radioimaging.

                                                                                                                                   The specification describes chirally pure peptides which are used for preparation of metal complexes. When converted to complexes with (radioactive) metals or their oxides or nitrides, the peptides are useful for diagnostic (radio) imaging (by labeling biomolecules). The present peptide is used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
Chirally pure peptides for preparation of metal complexes, used for diagnostic imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

contiguous amino acids for complexing with metal ion

```
Tuftsin metallopeptide, useful e.g. for imaging site of infection or inflammation, comprises metal ion-binding backbone including at least two
New peptide-chelator conjugate and complex with traceable metal - used to image sites of inflammation in vivo without significant accumulation on the gastrointestinal tract.
                                                                                       The present sequence is that of a specifically claimed peptide- chelator conjugate in which a tuftsin antagonist peptide is coupled to a metal chelator, via a linking group. The chelator serves as a labelling site for radionuclide metals such as technetium-99m. The tuftsin antagonist targets the conjugate to macrophages and neutrophils at sites of inflammation without significant accumulation in the gastrointestinal tract (unlike the native tuftsin tetrapeptide). The conjugate is thus useful for diagnostic imaging of inflammation sites, providing an improved target to background ratio
                                                                                                                                                                                                                                                                                                              Gaps

The invention describes a peptide or its salt comprising a metal ion-
binding backbone including at least two contiguous amino acids for
complexing with the metal ion. The peptide is specific for the tuftein
complexing the metal ion. The peptide is specific for the tuftein
complexing with the metal ion-binding backbone with the metal ion.
The peptide is useful for imaging a site of infection or inflammation;
cor causing an immunostimulatory response in mammals; for treating immune
system disorders; in biological, pharmaceutical and radiopharmaceutical
applications; as an analgesic in the treatment of CMS conditions; and in
whole body imaging and radiotherapy. The peptide complexed with the metal ion the peptide complexed with the metal ion. The affinity of the peptide
complexed with the metal ion. The Tc-labeled Thr-D-Lys-
complexed with the metal ion. The Tc-labeled Thr-D-Lys-
dly-D-Cys-Arg is the most potent existing tuftsin molecule. The peptide-
complexed with the uncomplexed or existing peptide.

Cys-Arg is the most potent existing tuftsin molecule. The peptide-
complexed with the metal ion. The metal ion binding peptide-
conformation with a metal ion. The metal complexation in the peptide.

Causes specific regional conformationally restrictions in the peptide
conformationally fixed on metal conformation. The complexation of the
conformationally fixed on metal ion complexation. The complexation of the
conformationally fixed on metal conformations at the peptide metal ion complex stimulates polymorphonuclear
conformationally fixed on metal conformations the proposed pagacytosis, produces
conformationally fixed on metal conformations the granulocytes, monocytes and macrophages towards phagocytosis, produce
conformatic enzymatic or peptides ederadation This is the amino acid
cycles, monocytes and macrophages towards phagocytosis, produce
chigher titer antibodies, and can transit the gut-blood barrier without
significant enzymatic or peptidase degradation this is the metal on cycles and macral produces to the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       immunostimulant; immunosuppressive; tuftsin receptor binder;

New peptide-chelator conjugate and complex with traceable metal - used to image sites of inflammation in vivo without significant accumulation on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of a specifically claimed peptide- chelator conjugate in which a tuftsin antagonist peptide is coupled to a metal chelator, via a linking group. The chelator serves as a labelling site for radionuclide metals such as technetiun-99m. The tuftsin antagonist targets the conjugate to macrophages and neutrophils at sites of inflammation without significant accumulation in the gastrointestinal tract (unlike the native tuftsin tetrapeptide). The conjugate is thus useful for diagnostic imaging of inflammation sites, providing an improved target to background ratio
                                                                                                                                                                              /label= OTHER
/note= "picolinic acid or benzoyl-mercaptoacetic acid"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Phagocytosis; tuftsin; endothelial cell; inflammation; cytostatic; antiangiogenic; NP-1; ultrasound contrast agent; tumour; angiogenesis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a peptide or its salt comprising a metal ion-
binding backbone including at least two contiguous amino acids for
complexing with the metal ion. The peptide is specific for the tuftsin
receptor on complexing the metal ion-binding backbone with the metal ion.
The peptide is useful for imaging a site of infection or inflammation;
The peptide is useful for imaging a site of infection or inflammation;
The peptide is useful for imaging a site of infection or inflammation;
The causing an immunostimulatory response in mammals; for treating immune
applications; as an analgesic in the treatment of CNS conditions; and in
whole body imaging and radiotherapy. The peptide complexed with the metal ion binding backbone is
complexed with the metal ion. The affinity of the peptide
for the tuffsin receptor is higher when the metal ion-binding backbone is
complexed with the metal ion. The Tc-labeled Thr-D-Lys-
complexed with the metal ion. The Tc-labeled Thr-D-Lys-
acception is not complexed with the metal ion. The Tc-labeled Thr-D-Lys-
complexes have a higher level of stability, and are less
uscapilate to proteclysis than the uncomplexed or existing peptide.
The peptide analogue is not conformationally restricted in the absence of a metal ion but has high potency and concomicant conformation with a metal ion. The metal complexation in the peptide
conformationally fixed on metal complexation. The complexation of the
conformationally fixed on metal ion. The metal binding site is
conformationally fixed on metal ion complexes towards phagocytosis, produces
mammals. The peptide metal ion complex stimulates polymorphonuclear
granulocytes, monocytes and macrophages towards phagocytosis, produces
higher titer antibodies, and can transit the public derivation and can transit the invention.
Supplication enzymatic or peptidase degradation. This is the amino acid
sequence of a tuftsin metallopeptide analogue of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                             Tuftsin metallopeptide, useful e.g. for imaging site of infection or inflammation, comprises metal ion-binding backbone including at least two contiguous amino acids for complexing with metal ion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a composition (A1) comprising compounds containing monomers, multimers or polymers of TKPPR (ADD10684).

(Composition (A1) comprises a compound of formula A-L-B 1, where A is the TKPPR peptide, L is a linker moiety (of formula given in the specification) and B is a substrate (or a phospholipid group, derivatisable bead attached to a fluorescent or radioactive marker, bioactive agent, delivery vehicle for genetic material, drug or therapeutic, or chelating group (preferably N 4 , S 4 , N 3 S, N 2 S or NS 3 ) comprising oxa-PhAO complexed with 99m Tc). The compound specifically binds to NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoprotein) or cells that express NP-1 with avidity of at least that of TKPPR. Also included are an ultrasound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Phagocytosis; tuftsin; endothelial cell; inflammation; cytostatic; antianglogenic; NP-1; ultrasound contrast agent; tumour; anglogenesis; visualisation therapy; radiotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /label= OTHER

CC composition (A1) comprises a compound of formula A-LB 1, where A is the

CC Composition (A1) comprises a compound of formula A-LB 1, where A is the

TXPPR peptide, I is a linker moiety (of formula A-LB 1, where A is the

TXPPR peptide, I is a linker moiety (of formula A-LB 1, where A is the

CC derivatisable bead attached to a fluorescent or radioactive marker,

Dioactive agent, delivery vehicle for genetic material, drug or

therapeutic, or chelating group (preferably N 4, S 4, N 3 S, N 2 S 2 or

NS 3) comprising oxa-PnAO complexed with 9gm TC: The compound

specifically binds to NP-1 (Vascular endothelial growth factor binding

CC comprising a tleast that of TXPPR. Also included are an ultrasound

contrast agent (C1) comprising a suspension of gas filled microbubles

CC comprising the TXPPR compound, an ultrasound contrast agent (C2)

CC comprising a suspension of gas filled microbubles

CC comprising a suspension of gas filled microbubles

CC comprising a suspension of gas filled microbubles

CC comprising a compound of formula A-L, forming a covalent bond between

CC compound, preparation of formula A-L, forming a covalent bond between

CC the monomer, multimer or polymer of TXPPR or its analogue with a linker

CC obcain a compound of formula A-L, forming a covalent bond between

CC the compound. The compound used for preparing a covalent bond between

CC bond between A-L and the substrate B i or forming a covalent bond between

CC the compound. The compound used for target endothelial cells, tumour cells or other cells which express NP-1, for inhibiting angiogenesis, for

CC ultrasound imaging, stading a tumour, screening a least one targeted

CC ultrasound imaging, stading a tumour screening and endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic

CC acids to endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic

CC acids to endothelial cells, tumour cells or other cells
                                                                                                                                  /label= OTHER

contrast agent (c1) comprising a suspension of gas filled microbubbles comprising the TKPPR compound, an ultrasound contrast agent (c2) comprising the TKPPR compound (which comprising the TKPPR compound (which comprises conjugating the TKPPR compound, preparation of the TKPPR compound (which comprises conjugating the monomer, multimer or polymer of TKPPR or its analogue with a linker to compound of formula A-L, forming a covalent or non-covalent bond between A-L and the substrate B l or forming a covalent bond between B l and the linker to form a conjugate B-L followed by conjugation with the compound. The compound used for targeting endothelial cells, tumour cells or other cells which express NP-1, for inhibiting anglogenesis, for ultrasound imaging, traging a tumour, screening at least one targeted ultrasound imaging, traging a tumour, screening at least one targeted ultrasound imaging, traging a tumour, screening at least one targeted ultrasound contrast agent for the ability to target endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic delivery in vivo of a bloactive agent and for delivering desired nucleic acids to endothelial cells, tumour cells or other cells which express NP-1. The composition is also useful for visualisation therapy or capting the contrast of the cells. The present sequence is a TKPPR dimer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "residue modified by the following; F-108, OCH2CONH"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "residue modified by the following; F-108,

The invention relates to a composition for use in targeting endothelial cells, tumour cells, or other cells which express NP-1. The activity of compositions of the invention may be described as cytostatic. Compounds of the invention are useful in pharmaceutical compositions for inhibiting anglogenesis, for imaging and targeting an anglogenic site, endothelial cells, tumour cells or other cells that express NP-1 in a human or animal. They may also be used as ultrasound contrast agents, for staging a tumour in a human or animal. For screening for the ability of an agent to target endothelial cells, tumour cells or other cells that express NP-1. They may be used for therapeutic delivery in vivo of a bloactive agent or feated disorder. They may be used for delivering effects of an anglogenesis or a related disorder. They may be used for delivering desired mucleic acids to endothelial cells, tumour cells or cher cells expressing NP-1, for characting endothelial or tumour cell-targeted gene therapy, or gene therapy targeting anglogenic cells, and for treating a human or animal with a tumour or anglogenesis-related disease. The current sequence therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                 Composition for use in targeting endothelial cells, tumor cells or other cells which express NP-1 comprises a compound containing a polypeptide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tuftsin, endothelial cell, drug delivery, gene therapy, NP-1,

Composition for use in targeting endothelial cells, tumor cells or other cells which express NP-1 comprises a compound containing a polypeptide, linker and substrate.

Example 37; Page 128; 146pp; English.

The invention relates to a composition for use in targeting endothelial cells, tumour cells, or other cells which express NP-1. The activity of compositions of the invention may be described as cyrostatic. Compounds of the invention are useful in pharmaceutical compositions for inhibiting angiogenesis, for imaging and targeting an angiogenic site, endothelial cells, tumour cells or other cells that express NP-1 in a human or animal, for screening for the ability of an agent to target endothelial cells, tumour cells or other cells that express NP-1. They may be used for therapeutic delivery in vivo of a bioactive agent or for treating an individual exhibiting effects of an angiogenesis or created disorder. They may be used for delivery in vivo of a bioactive agent or for treating an individual exhibiting effects of an angiogenesis or a related disorder. They may be used for delivering desired nucleic acids to enhancing endothelial or tumour cells or other cells expressing NP-1, for enhancing endothelial or tumour cells, and for treating a human or animal with a tumour or angiogenesis-related disease. The current sequence complexed with a radioactive metal that is described in the specification as 99mTc radiopharmaceutical

Sequences ABP31028-ABP35561 represent 4534 novel human proteins designated ORF (open reading frame) 1-4534, and sequences ABN75054-ABP35054 represent Confise encoding them. The invention also encompasses polypeptides at least 804 identical to the ORF1-ORF4534 (collectively referred to as ORFX) proteins, polynucleotides at least 854 identical to the ORF2 offers and host cells comprising ORFX polynucleotides, the recombinant production of ORFX proteins, antibodies specific for ORFX proteins, methods of detecting ORFX proteins, antibodies and polypeptides, methods of screening for modulators of ORFX expression or activity, and methods of screening for modulators of ORFX expression or activity, and methods of screening for modulation a predisposition to an ORFX-associated disorder. The ORFX proteins of the invention have a wide range of biological activities, such as cytokine, cell proliferation, tissue growth, angiogenesis, activin or inhibin activity, chemotactic/chemokinetic activity, hadmostatic activity, thrombolytic activity, and antibidismatory activity, tumour inhibition activity, and antibidismatory activity, tumour inhibition activity, and antibidises may be used in the treatment of cancers, other proliferative disorders may be used in the treatment of cancers, other proliferative disorders may be used in the treatment of cancers, other proliferative disorders may be used in the treatment of cancers, other proliferative disorders may be used in the treatment of cancers, other proliferative disorders may be assed in the treatment of cancers, other proliferative disorders may be assed in the treatment of cancers, other proliferative disorders may be assed in the treatment of cancers, other proliferative disorders may be assed in the treatment of cancers, other proliferative disorders may be assed in the disorder may a sepilepsy and Alzeimer. ORFX nucleic acids may also be used as a source of primers and probes, in the detection of ORFX genomic sequences or transcripts, in the identification and cloning of homologous sequences, in genetic diagnosis, and in forensic biology. The ORFX nucleic acids may additionally be used to produce transgenic animals which may be useful for studying the function and/or activity of ORFX protein, and in drug screening. The ORFX proteins may also be used as immunogens to generate specific antibodies, which are useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            proteins may also be used as sp, which are useful in the text associated in the text associated.

(first entry) 13-FEB-2002

Novel human diagnostic protein #6998.

```
The invention relates to isolated polymuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGN primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymuclecitides are also used and in recombinant production of (II). The polymuclecitides are also used can disconstics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders in or biological activity. The polypeptide and polypurclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this pattent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
